

```
class X {  
    beanFactory.getBean("a");  
}
```

if it is an internal object of the container, we cannot get the reference of it, only container has to provide
Container: tells us to follow the contract
write your class implementing from an interface and override the method taking the dependency as parameter.

the container itself will inject the dependent object into our class, at the time of creating the object of our class
